

Call for Abstracts

Geoscientists' Little Helpers Small software tools with big impact (Session 14c)

Working with data over the years results almost inevitably in self-made code snippets, scripts or spreadsheets, and sometimes even full-fledged programmes that optimise workflows, reduce workload and significantly speed up daily tasks. Some of them make it to the public but most remain invisible, hidden behind the outcomes of the research they are helping with. However, many of them are not shy but did not have the possibility to shine, yet. We provide a spotlight for them, so that the scientific community may benefit. We welcome presentations about all kinds of self-made software that facilitate our research. The presented tools can be written in any programming language and

be in any stage of their development. We aim to raise awareness of what is already out there, to facilitate sharing of the tools and to foster collaborations for their development.
